What is the “power” in data storytelling that the speaker emphasizes, and why does she believe it matters in influencing decisions or actions?

- In the near end of the video, Malavica said that the "power" in data storytelling is the plot-twist that changes the human narrative, shifts perspectives, and transforms how a business runs fundamentally. This was shown through her example of a Soy Milk Business.

How does she define or illustrate the role of audience awareness in crafting a data story?

- It is to understand what the user needs to know or gain. She defined it through the first step of the framework, making a clear quest. This step is where we need to think about what factors we need to take account of to see what we are looking for.

What example(s) does she give of a visualization or story gone wrong and what are the root causes of the failure according to her?

- She gave a story about the first ever phone released commercially that failed to sell. According to her, the root cause of this invention to fail is because the manufacturer did not clearly define what problem they were solving when making the invention.

Which “preattentive” or design principles does she highlight as important for making charts communicate more clearly (for example: color, size, position, emphasis)?

- She didn't highlight anything about how to make charts more clearly in terms of characteristics, but more on the fundamentals. Malavica presented a framework with three steps; define the problem, visualize what a solution might look like, and get the right tools. These are what helped her improve in data story telling and it saves time.

Based on her advice, how would you redesign one of your own visualizations (or a chart you’ve seen) to better tell a story? What would you change and why?

- I would redesign my own visualizations (dashboard) around a "DEFINED" problem. And to execute this properly, I would need to visualize and present what a solution might look like for the audience to understand. Lastly, I would highlight unexpected data points from the charts for a much more compelling presentation.
